

TENTATIVE TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

288Mbits Network FCRAM2 (I-version)

– 4,194,304-WORDS × 4 BANKS × 18-BITS

DESCRIPTION

Network FCRAM™ is Double Data Rate Fast Cycle Random Access Memory. TC59LM818DMBI is Network FCRAM™ containing 301,989,888 memory cells. TC59LM818DMBI is organized as 4,194,304-words × 4 banks × 18 bits. TC59LM818DMBI feature a fully synchronous operation referenced to clock edge whereby all operations are synchronized at a clock input which enables high performance and simple user interface coexistence. TC59LM818DMBI can operate fast core cycle compared with regular DDR SDRAM.

TC59LM818DMBI is suitable for Network, Server and other applications where large memory density and low power consumption are required. The Output Driver for Network FCRAM™ is capable of high quality fast data transfer under light loading condition. TC59LM818DMBI guarantees –40deg°C to 100deg°C operating temperature so it is suitable for use in wide operating temperature system.

FEATURES

PARAMETER		TC59LM818DMBI	
		-37	
t _{CK} Clock Cycle Time (min)	CL = 4	5.0 ns	
	CL = 5	4.0 ns	
	CL = 6	3.75 ns	
t _{RC} Random Read/Write Cycle Time (min)			25 ns
t _{RAC} Random Access Time (max)			25 ns
I _{DD1S} Operating Current (single bank) (max)			220 mA
I _{DD2P} Power Down Current (max)			65 mA

- Fully Synchronous Operation
 - Double Data Rate (DDR)
 - Data input/output are synchronized with both edges of DS / QS.
 - Differential Clock (CLK and $\overline{\text{CLK}}$) inputs
 - CS, FN and all address input signals are sampled on the positive edge of CLK.
 - Output data (DQs and QS) is aligned to the crossings of CLK and $\overline{\text{CLK}}$.
- Fast clock cycle time of 3.75 ns minimum
 - Clock: 266 MHz maximum
 - Data: 533 Mbps/pin maximum
- Operating Temperature : –40deg°C ~ 100deg°C (Case Temperature)
- Quad Independent Banks operation
- Fast cycle and Short Latency
- Selectable Data Strobe
- Distributed Auto-Refresh cycle in 1.95 μs
- Power Down Mode
- Variable Write Length Control
- Write Latency = $\overline{\text{CAS}}$ Latency-1
- Programmable $\overline{\text{CAS}}$ Latency and Burst Length
 - $\overline{\text{CAS}}$ Latency = 4, 5, 6
 - Burst Length = 2, 4
- Organization: 4,194,304 words × 4 banks × 18 bits
- Power Supply Voltage V_{DD}: 2.5 V ± 0.125V
 - V_{DDQ}: 1.7 V ~ 1.9 V
- Low voltage CMOS I/O covered with SSTL_18 (Half strength driver)
- Package: 60Ball BGA, 1mm × 1mm Ball pitch (P-BGA60-0917-1.00AZ)

Notice: FCRAM is trademark of Fujitsu limited, Japan.

PIN NAMES

PIN	NAME
A0~A14	Address Input
BA0, BA1	Bank Address
DQ0~DQ17	Data Input/Output
\overline{CS}	Chip Select
FN	Function Control
\overline{PD}	Power Down Control
CLK, \overline{CLK}	Clock Input
DS / QS	Write/Read Data Strobe
V _{DD}	Power (+2.5 V)
V _{SS}	Ground
V _{DDQ}	Power (+1.8 V) (for DQ buffer)
V _{SSQ}	Ground (for DQ buffer)
V _{REF}	Reference Voltage
NC	Not Connected

PIN ASSIGNMENT (TOP VIEW)

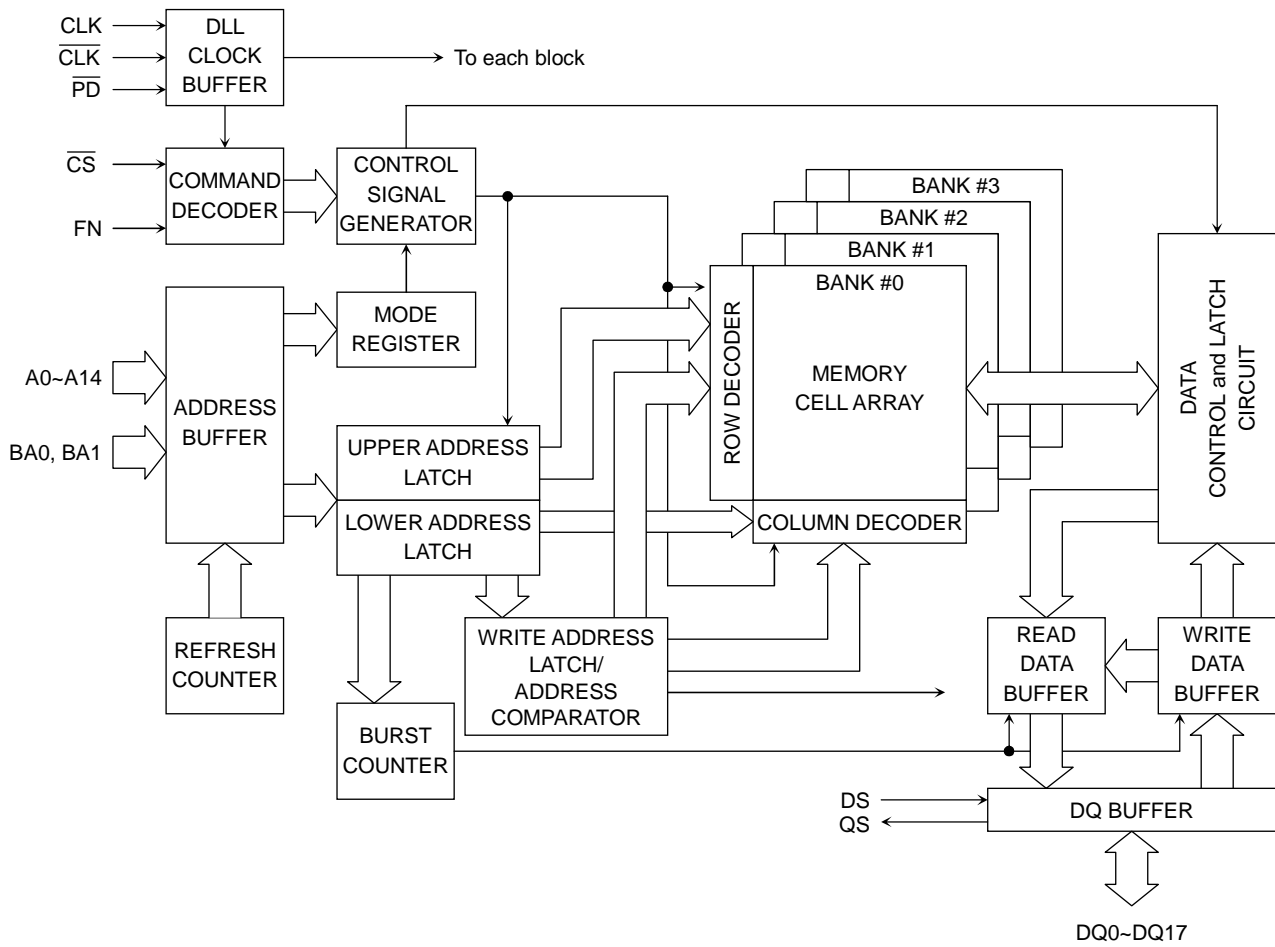

ball pitch=1.0 x 1.0mm

x18

○ : Depopulated Ball

BLOCK DIAGRAM

Note: The TC59LM818DMBI configuration is 4 Bank of 32768 × 128 × 18 of cell array with the DQ pins numbered DQ0-DQ17.

ABSOLUTE MAXIMUM RATINGS

SYMBOL	PARAMETER	RATING	UNIT	NOTES
V _{DD}	Power Supply Voltage	-0.3~ 3.3	V	
V _{DDQ}	Power Supply Voltage (for DQ buffer)	-0.3~V _{DD} + 0.3	V	
V _{IN}	Input Voltage	-0.3~V _{DD} + 0.3	V	
V _{OUT}	Output and I/O pin Voltage	-0.3~V _{DDQ} + 0.3	V	
V _{REF}	Input Reference Voltage	-0.3~V _{DD} + 0.3	V	
T _{opr}	Operating Temperature (case)	-40~100	°C	
T _{stg}	Storage Temperature	-55~150	°C	
T _{solder}	Soldering Temperature (10 s)	260	°C	
P _D	Power Dissipation	2	W	
I _{OUT}	Short Circuit Output Current	±50	mA	

Caution: Conditions outside the limits listed under "ABSOLUTE MAXIMUM RATINGS" may cause permanent damage to the device. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification.

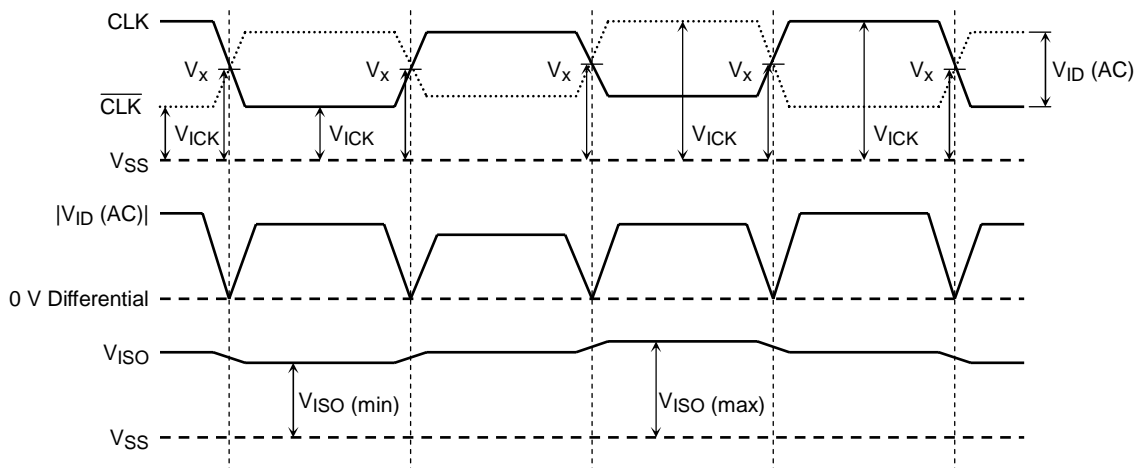

Exposure to "ABSOLUTE MAXIMUM RATINGS" conditions for extended periods may affect device reliability.

RECOMMENDED DC, AC OPERATING CONDITIONS (Notes: 1)(T_{CASE} = -40~100°C)

SYMBOL	PARAMETER	MIN	TYP.	MAX	UNIT	NOTES
V _{DD}	Power Supply Voltage	2.375	2.5	2.625	V	
V _{DDQ}	Power Supply Voltage (for DQ buffer)	1.7	—	1.9	V	
V _{REF}	Reference Voltage	V _{DDQ} /2 × 95%	V _{DDQ} /2	V _{DDQ} /2 × 105%	V	2
V _{IH} (DC)	Input DC High Voltage	V _{REF} + 0.125	—	V _{DDQ} + 0.2	V	5
V _{IL} (DC)	Input DC Low Voltage	-0.1	—	V _{REF} - 0.125	V	5
V _{ICK} (DC)	Differential Clock DC Input Voltage	-0.1	—	V _{DDQ} + 0.1	V	10
V _{ID} (DC)	Differential Input Voltage CLK and $\overline{\text{CLK}}$ inputs (DC)	0.4	—	V _{DDQ} + 0.2	V	7, 10
V _{IH} (AC)	Input AC High Voltage	V _{REF} + 0.2	—	V _{DDQ} + 0.2	V	3, 6
V _{IL} (AC)	Input AC Low Voltage	-0.1	—	V _{REF} - 0.2	V	4, 6
V _{ID} (AC)	Differential Input Voltage. CLK and $\overline{\text{CLK}}$ inputs (AC)	0.55	—	V _{DDQ} + 0.2	V	7, 10
V _X (AC)	Differential AC Input Cross Point Voltage	V _{DDQ} /2 - 0.125	—	V _{DDQ} /2 + 0.125	V	8, 10
V _{ISO} (AC)	Differential Clock AC Middle Level	V _{DDQ} /2 - 0.125	—	V _{DDQ} /2 + 0.125	V	9, 10

Note:

- (1) All voltages referenced to VSS, VSSQ.
- (2) VREF is expected to track variations in VDDQ DC level of the transmitting device.
Peak to peak AC noise on VREF may not exceed $\pm 2\%$ VREF (DC).
- (3) Overshoot limit: $V_{IH} (max) = V_{DDQ} + 0.7 \text{ V}$ with a pulse width $\leq 5 \text{ ns}$.
- (4) Undershoot limit: $V_{IL} (min) = -0.7 \text{ V}$ with a pulse width $\leq 5 \text{ ns}$.
- (5) $V_{IH} (DC)$ and $V_{IL} (DC)$ are levels to maintain the current logic state.
- (6) $V_{IH} (AC)$ and $V_{IL} (AC)$ are levels to change to the new logic state.
- (7) V_{ID} is differential voltage of CLK input level and \overline{CLK} input level.
- (8) The value of $V_X (AC)$ is expected to equal $V_{DDQ}/2$ of the transmitting device.
- (9) V_{ISO} means $\{V_{ICK} (CLK) + V_{ICK} (\overline{CLK})\} / 2$
- (10) Refer to the figure below.

- (11) In the case of external termination, V_{TT} (termination voltage) should be gone in the range of $V_{REF} (DC) \pm 0.04 \text{ V}$.

CAPACITANCE ($V_{DD} = 2.5\text{V}$, $V_{DDQ} = 1.8 \text{ V}$, $f = 1 \text{ MHz}$, $T_a = 25^\circ\text{C}$)

SYMBOL	PARAMETER	MIN	MAX	Delta	UNIT
C_{IN}	Input pin Capacitance	1.5	3.0	0.25	pF
C_{INC}	Clock pin (CLK, \overline{CLK}) Capacitance	1.5	3.0	0.25	pF
$C_{I/O}$	DQ, DS, QS Capacitance	2.5	3.5	0.5	pF
C_{NC}	NC pin Capacitance	—	1.5	—	pF

Note: These parameters are periodically sampled and not 100% tested.

RECOMMENDED DC OPERATING CONDITIONS

($V_{DD} = 2.5\text{ V} \pm 0.125\text{ V}$, $V_{DDQ} = 1.7\text{ V} \sim 1.9\text{ V}$, $T_{CASE} = -40 \sim 100^{\circ}\text{C}$)

SYMBOL	PARAMETER	MAX	UNIT	NOTES
		-37		
I _{DD1S}	Operating Current One bank read or write operation ; $t_{CK} = \text{min}$; $I_{RC} = \text{min}$, $I_{OUT} = 0\text{mA}$; Burst Length = 4, CAS Latency = 6, Free running QS mode ; $0\text{ V} \leq V_{IN} \leq V_{IL}(\text{AC}) (\text{max})$, $V_{IH}(\text{AC}) (\text{min}) \leq V_{IN} \leq V_{DDQ}$. Address inputs change up to 2 times during minimum I_{RC} , Read data change twice per clock cycle	220	mA	1, 2
	I _{DD2N}	Standby Current All banks: inactive state ; $t_{CK} = \text{min}$, $\overline{CS} = V_{IH}$, $\overline{PD} = V_{IH}$; $0\text{ V} \leq V_{IN} \leq V_{IL}(\text{AC}) (\text{max})$, $V_{IH}(\text{AC}) (\text{min}) \leq V_{IN} \leq V_{DDQ}$; Other input signals change one time during $4 \times t_{CK}$, DQ and DS inputs change twice per clock cycle		95
I _{DD2P}	Standby (power down) Current All banks: inactive state ; $t_{CK} = \text{min}$, $\overline{PD} = V_{IL}(\text{power down})$; CAS Latency = 6, Free running QS mode ; $0\text{ V} \leq V_{IN} \leq V_{IL}(\text{AC}) (\text{max})$, $V_{IH}(\text{AC}) (\text{min}) \leq V_{IN} \leq V_{DDQ}$; Other input signals change one time during $4 \times t_{CK}$, DQ and DS inputs are floating ($V_{DDQ}/2$)	65		1, 2
I _{DD4W}	Write Operating Current (4Banks) 4 Bank interleaved continuous burst write operation ; $t_{CK} = \text{min}$, $I_{RC} = \text{min}$; Burst Length = 4, CAS Latency = 6, Free running QS mode ; $0\text{ V} \leq V_{IN} \leq V_{IL}(\text{AC}) (\text{max})$, $V_{IH}(\text{AC}) (\text{min}) \leq V_{IN} \leq V_{DDQ}$; Address inputs change once per clock cycle, DQ and DS inputs change twice per clock cycle	420		1, 2
I _{DD4R}	Read Operating Current (4Banks) 4 Bank interleaved continuous burst read operation ; $t_{CK} = \text{min}$, $I_{RC} = \text{min}$, $I_{OUT} = 0\text{mA}$; Burst Length = 4, CAS Latency = 6, Free running QS mode ; $0\text{ V} \leq V_{IN} \leq V_{IL}(\text{AC}) (\text{max})$, $V_{IH}(\text{AC}) (\text{min}) \leq V_{IN} \leq V_{DDQ}$; Address inputs change once per clock cycle, Read data change twice per clock cycle	420		1, 2
I _{DD5B}	Burst Auto Refresh Current Refresh command at every I_{REFC} interval ; $t_{CK} = \text{min}$; $I_{REFC} = \text{min}$; CAS Latency = 6, Free running QS mode ; $0\text{ V} \leq V_{IN} \leq V_{IL}(\text{AC}) (\text{max})$, $V_{IH}(\text{AC}) (\text{min}) \leq V_{IN} \leq V_{DDQ}$. Address inputs change up to 2 times during minimum I_{REFC} , DQ and DS inputs change twice per clock cycle	220		1, 2, 3

- Notes: 1. These parameters depend on the cycle rate and these values are measured at a cycle rate with the minimum values of t_{CK} , t_{RC} and I_{RC} .
2. These parameters define the current between V_{DD} and V_{SS} .
3. I_{DD5B} is specified under burst refresh condition. Actual system should use distributed refresh that meet to t_{REFI} specification.

RECOMMENDED DC OPERATING CONDITIONS (continued)

($V_{DD} = 2.5\text{ V} \pm 0.125\text{ V}$, $V_{DDQ} = 1.7\text{ V} \sim 1.9\text{ V}$, $T_{CASE} = -40 \sim 100^{\circ}\text{C}$)

SYMBOL	PARAMETER		MIN	MAX	UNIT	NOTES	
I_{LI}	Input Leakage Current ($0\text{ V} \leq V_{IN} \leq V_{DDQ}$, all other pins not under test = 0 V)		-5	5	μA		
I_{LO}	Output Leakage Current (Output disabled, $0\text{ V} \leq V_{OUT} \leq V_{DDQ}$)		-5	5	μA		
I_{REF}	V_{REF} Current		-5	5	μA		
$I_{OH}(\text{DC})$	Normal Output Driver	Output DC Current ($V_{DDQ} = 1.7\text{V} \sim 1.9\text{V}$)	$V_{OH} = 1.420\text{ V}$	-5.6	—	mA	1
$I_{OL}(\text{DC})$			$V_{OL} = 0.280\text{ V}$	5.6	—		
$I_{OH}(\text{DC})$	Strong Output Driver		$V_{OH} = 1.420\text{ V}$	-9.8	—		
$I_{OL}(\text{DC})$			$V_{OL} = 0.280\text{ V}$	9.8	—		
$I_{OH}(\text{DC})$	Weak Output Driver		$V_{OH} = 1.420\text{ V}$	-2.8	—		
$I_{OL}(\text{DC})$			$V_{OL} = 0.280\text{ V}$	2.8	—		

Notes: 1. Refer to output driver characteristics for the detail. Output Driver Strength is selected by Extended Mode Register.

AC CHARACTERISTICS AND OPERATING CONDITIONS (Notes: 1, 2)

($V_{DD} = 2.5\text{ V} \pm 0.125\text{V}$, $V_{DDQ} = 1.7\text{V} \sim 1.9\text{V}$, $T_{CASE} = -40 \sim 100^{\circ}\text{C}$)

AC TEST CONDITIONS

SYMBOL	PARAMETER	VALUE	UNIT	NOTES
$V_{IH (min)}$	Input High Voltage (minimum)	$V_{REF} + 0.2$	V	
$V_{IL (max)}$	Input Low Voltage (maximum)	$V_{REF} - 0.2$	V	
V_{REF}	Input Reference Voltage	$V_{DDQ}/2$	V	
V_{TT}	Termination Voltage	V_{REF}	V	
V_{SWING}	Input Signal Peak to Peak Swing	0.8	V	
V_r	Differential Clock Input Reference Level	$V_X (AC)$	V	
$V_{ID (AC)}$	Input Differential Voltage	1.0	V	
SLEW	Input Signal Minimum Slew Rate	2.5	V/ns	
V_{OTR}	Output Timing Measurement Reference Voltage	$V_{DDQ}/2$	V	9

Note:

- (1) Transition times are measured between $V_{IH \min (DC)}$ and $V_{IL \max (DC)}$.
Transition (rise and fall) of input signals have a fixed slope.
- (2) If the result of nominal calculation with regard to t_{CK} contains more than one decimal place, the result is rounded up to the nearest decimal place.
(i.e., $t_{DSP(min)} = 0.45 \times t_{CK}$, $t_{CK} = 3.75 \text{ ns}$, $0.45 \times 3.75 \text{ ns} = 1.6875 \text{ ns}$ is rounded up to 1.7 ns.)
- (3) These parameters are measured from the differential clock (CLK and \overline{CLK}) AC cross point.
- (4) These parameters are measured from signal transition point of DS crossing V_{REF} level.
- (5) The $t_{REFI (max)}$ applies to equally distributed refresh method.
The $t_{REFI (min)}$ applies to both burst refresh method and distributed refresh method.
In such case, the average interval of eight consecutive Auto-Refresh commands has to be more than 400 ns always. In other words, the number of Auto-Refresh cycles which can be performed within 3.2 μs ($8 \times 400 \text{ ns}$) is to 8 times in the maximum.
- (6) Low Impedance State is specified at $V_{DDQ}/2 \pm 0.1 \text{ V}$ from steady state.
- (7) High Impedance State is specified where output buffer is no longer driven.
- (8) These parameters depend on the clock jitter. These parameters are measured at stable clock.
- (9) Output timing is measured by using Normal driver strength at $V_{DDQ} = 1.7 \sim 1.9\text{V}$.

POWER UP SEQUENCE

- (1) As for \overline{PD} , being maintained by the low state ($\leq 0.2V$) is desirable before a power-supply injection.
- (2) Apply V_{DD} before or at the same time as V_{DDQ} .
- (3) Apply V_{DDQ} before or at the same time as V_{REF} .
- (4) Start clock (CLK , \overline{CLK}) and maintain stable condition for 200 μs (min).
- (5) After stable power and clock, apply DES_L and take $\overline{PD} = H$.
- (6) Issue $EMRS$ to enable DLL and to define driver strength and data strobe type. (Note: 1)
- (7) Issue MRS for set \overline{CAS} latency (CL), Burst Type (BT), and Burst Length (BL). (Note: 1)
- (8) Issue two or more Auto-Refresh commands (Note: 1).
- (9) Ready for normal operation after 200 clocks from Extended Mode Register programming.

Notes:

- (1) Sequence 6, 7 and 8 can be issued in random order.
- (2) L = Logic Low, H = Logic High
- (3) DQ output is Hi-Z state during power upsequence.

TIMING DIAGRAMS

Input Timing

Command and Address

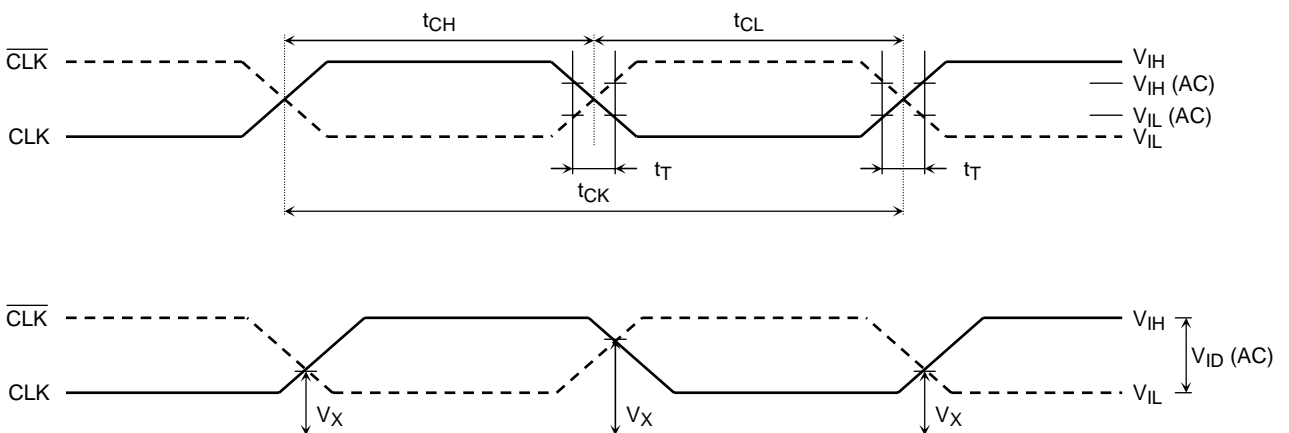

Data

Refer to the Command Truth Table.

Timing of the CLK, $\overline{\text{CLK}}$

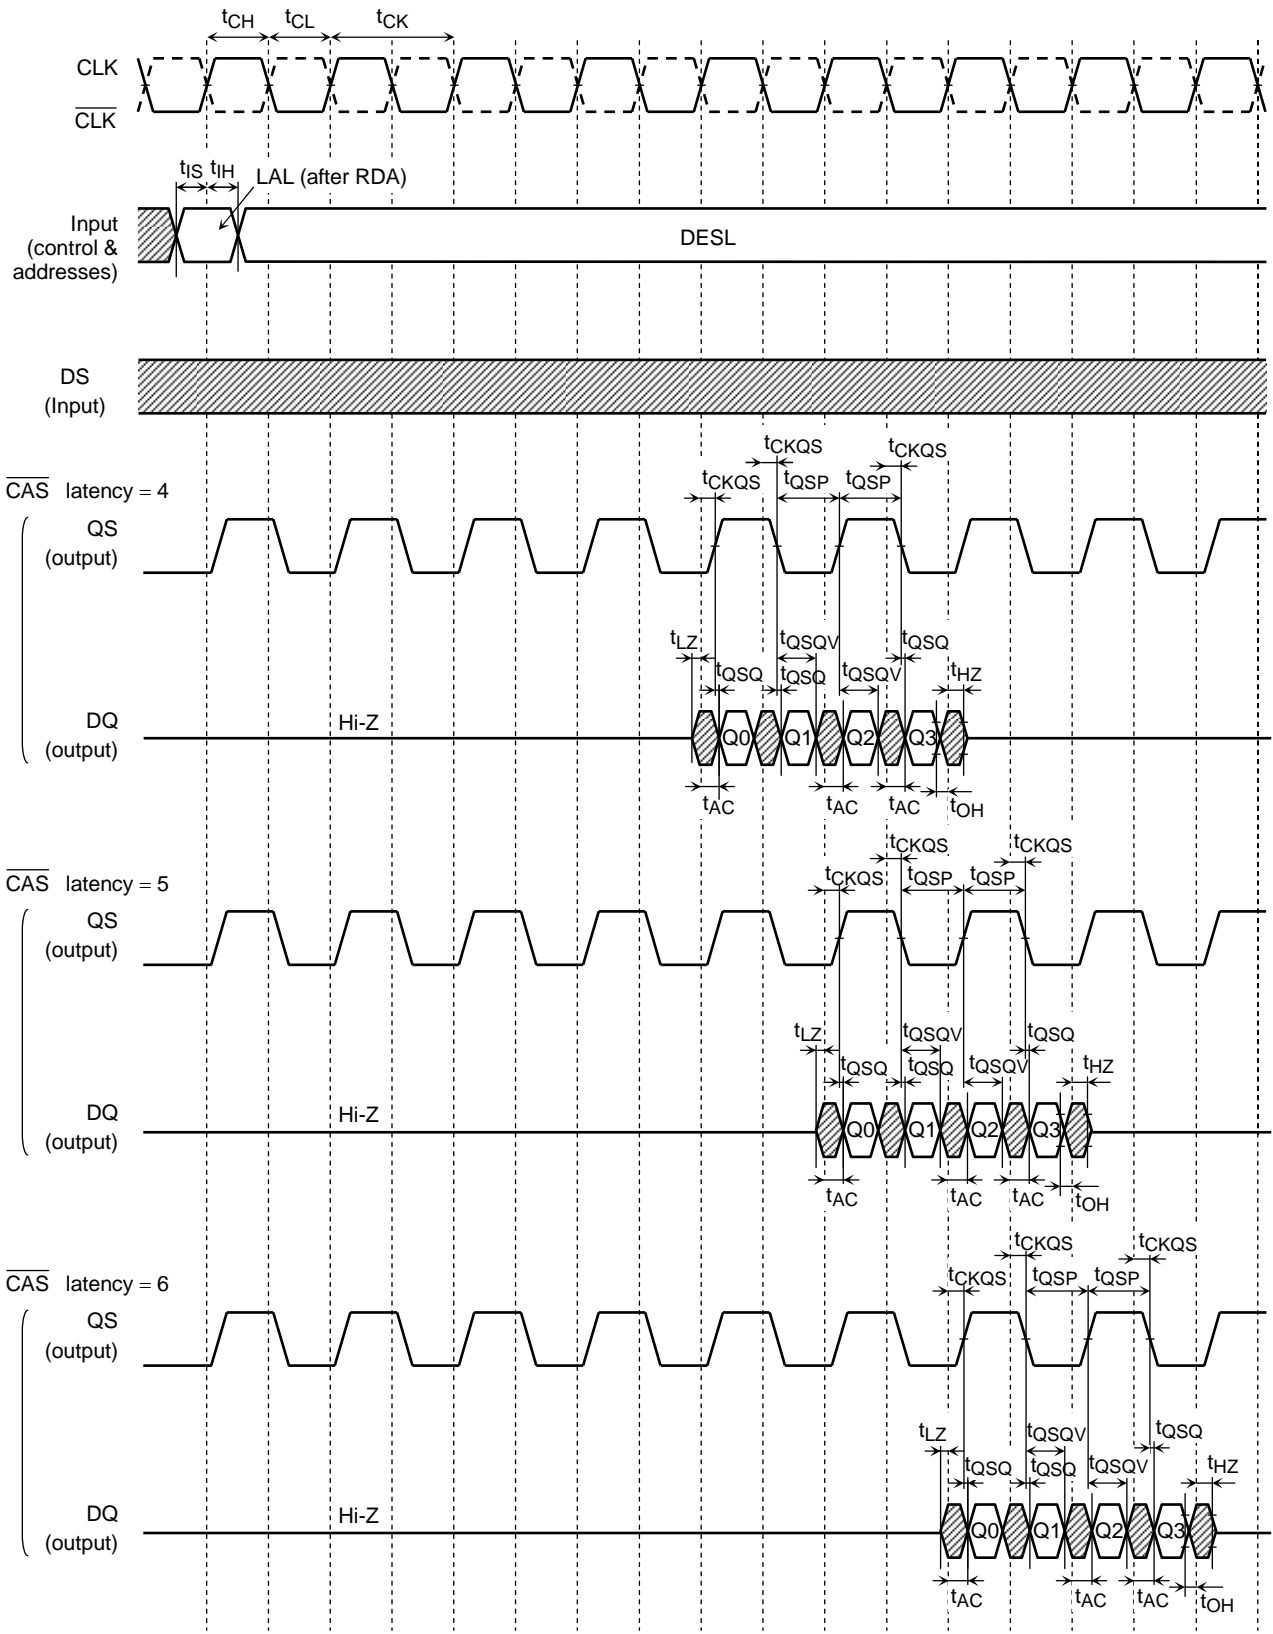

Read Timing (Burst Length = 4)

Unidirectional DS/QS mode

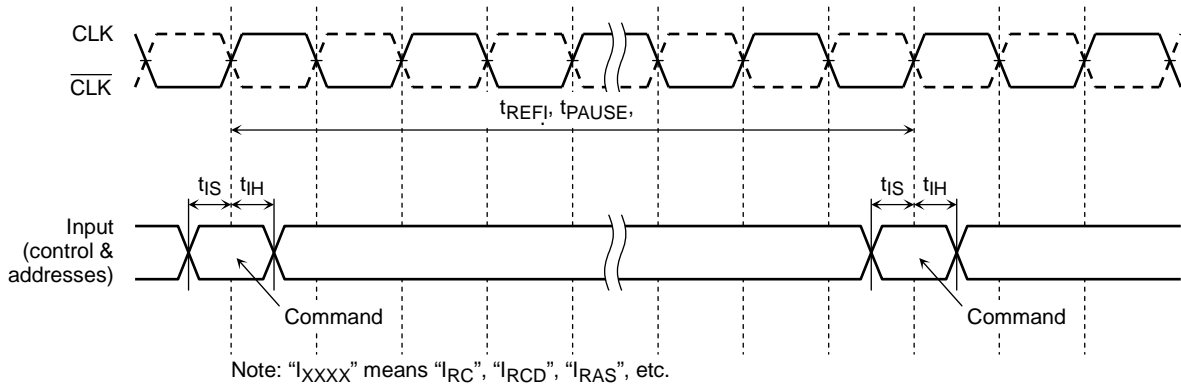

Note: DQ0 to DQ17 are aligned with QS.

Read Timing (Burst Length = 4)
 Unidirectional DS/Free Running QS mode

Note: DQ0 to DQ17 are aligned with QS.
 QS is always asserted in Free Running QS mode.

tREFI, tPAUSE, I_{XXXX} Timing

FUNCTION TRUTH TABLE (Notes: 1, 2, 3)

Command Truth Table (Notes: 4)

• The First Command

SYMBOL	FUNCTION	\overline{CS}	FN	BA1~BA0	A14~A9	A8	A7	A6~A0

	H	H	L	L	BA, UA	WRA	Illegal	11
Auto-Refreshing	H	L	H	x	x	PDEN	Illegal	
	H	L	L	x	x	—	Illegal	
	L	x	x	x	x	—	Illegal	
	H	H	H	x	x	DESL	NOP → Idle after IREFC	
	H	H	L	H	BA, UA	RDA	Illegal	
Mode Register Accessing	H	H	L	L	BA, UA	WRA	Illegal	
	H	L	H	x	x	PDEN	Illegal	
	H	L	L	x	x	—	Illegal	
	L	x	x	x	x	—	Invalid	
	Power Down	H	x	x	x	x	—	Invalid
L		L	x	x	x	—	Maintain Power Down Mode	
L		H	H	x	x	PDEX	Exit Power Down Mode → Idle after tPDEX	
L		H	L	x	x	—	Illegal	

Notes: 10. Illegal if any bank is not idle.

11. Illegal to bank in specified states; Function may be legal in the bank indicated by Bank Address (BA).

MODE REGISTER TABLE

Regular Mode Register (Notes: 1)

ADDRESS	BA1 ^{*1}	BA0 ^{*1}	A14~A8	A7 ^{*3}	A6~A4	A3	A2~A0
Register	0	0	0	TE	CL	BT	BL

A7	TEST MODE (TE)
0	Regular (default)
1	Test Mode Entry

A3	BURST TYPE (BT)
0	Sequential
1	Interleave

A6	A5	A4	CAS [¯] LATENCY (CL)
0	0	×	Reserved ^{*2}
0	1	0	Reserved ^{*2}
0	1	1	Reserved ^{*2}
1	0	0	4
1	0	1	5
1	1	0	6
1	1	1	Reserved ^{*2}

A2	A1	A0	BURST LENGTH (BL)
0	0	0	Reserved ^{*2}
0	0	1	2
0	1	0	4
0	1	1	Reserved ^{*2}
1	×	×	

Extended Mode Register (Notes: 4)

ADDRESS	BA1 ^{*4}	BA0 ^{*4}	A14~A7	A6~A5	A4~A3	A2~A1	A0 ^{*5}
Register	0	1	0	SS	DIC (QS)	DIC (DQ)	DS

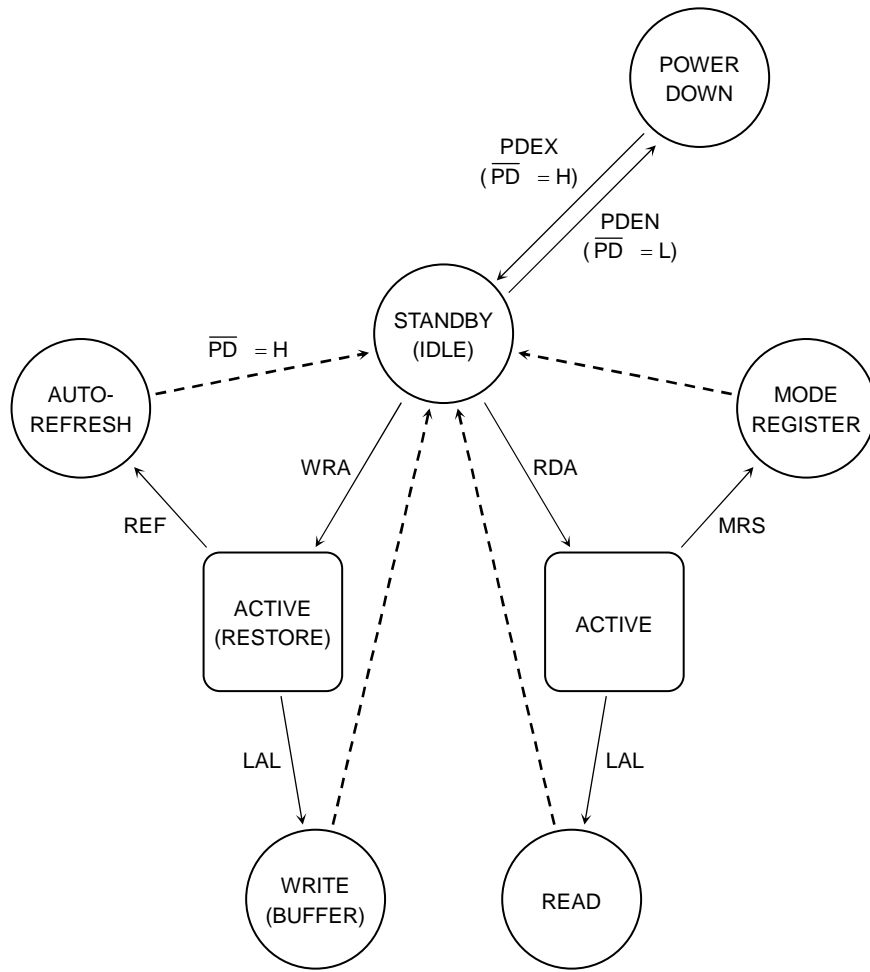

A6	A5	STROBE SELECT
0	0	Reserved ^{*2}
0	1	Reserved ^{*2}
1	0	Unidirectional DS/QS
1	1	Unidirectional DS/Free Running QS

QS		DQ		OUTPUT DRIVE IMPEDANCE CONTROL (DIC)
A4	A3	A2	A1	
0	0	0	0	Normal Output Driver
0	1	0	1	Strong Output Driver
1	0	1	0	Weak Output Driver
1	1	1	1	Reserved

A0	DLL SWITCH (DS)
0	DLL Enable
1	DLL Disable

- Notes:
- Regular Mode Register is chosen using the combination of BA0 = 0 and BA1 = 0.
 - "Reserved" places in Regular Mode Register should not be set.
 - A7 in Regular Mode Register must be set to "0" (low state).
Because Test Mode is specific mode for supplier.
 - Extended Mode Register is chosen using the combination of BA0 = 1 and BA1 = 0.
 - A0 in Extended Mode Register must be set to "0" to enable DLL for normal operation.

STATE DIAGRAM

————> Command input
- - - -> Automatic return

The second command at Active state must be issued 1 clock after RDA or WRA command input.

TIMING DIAGRAMS

Unidirectional DS/QS mode

Unidirectional DS/Free Running QS mode

MULTIPLE BANK READ TIMING (CL = 4)

Note: I_{RC} to the same bank must be satisfied.

MULTIPLE BANK READ TIMING (CL = 5)

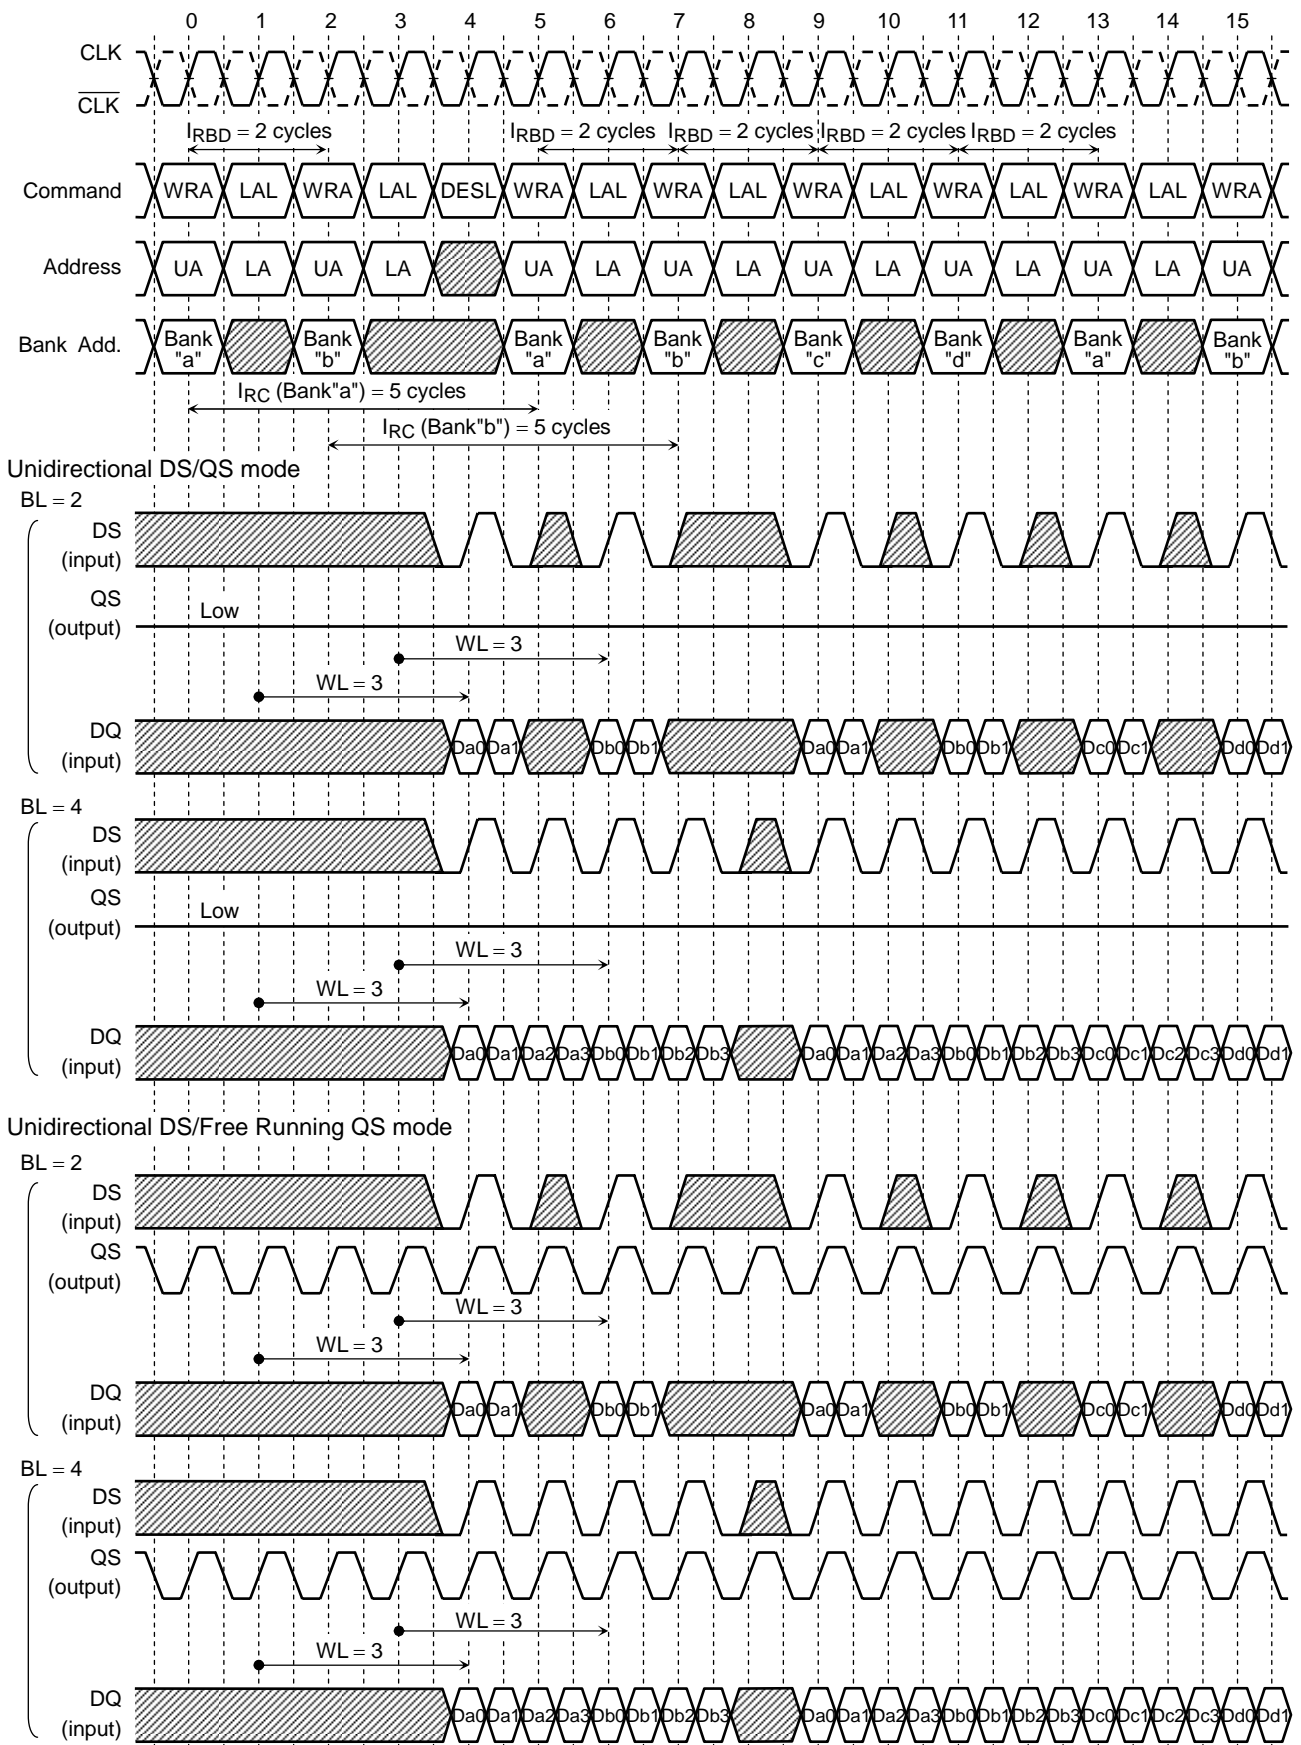

Note: I_{RC} to the same bank must be satisfied.

MULTIPLE BANK READ TIMING (CL = 6)

MULTIPLE BANK WRITE TIMING (CL = 4)

Note: I_{RC} to the same bank must be satisfied.

MULTIPLE BANK WRITE TIMING (CL = 5)

Note: I_{RC} to the same bank must be satisfied.

MULTIPLE BANK WRITE TIMING (CL = 6)

Note: IRC to the same bank must be satisfied.

MULTIPLE BANK READ-WRITE TIMING (BL = 2)

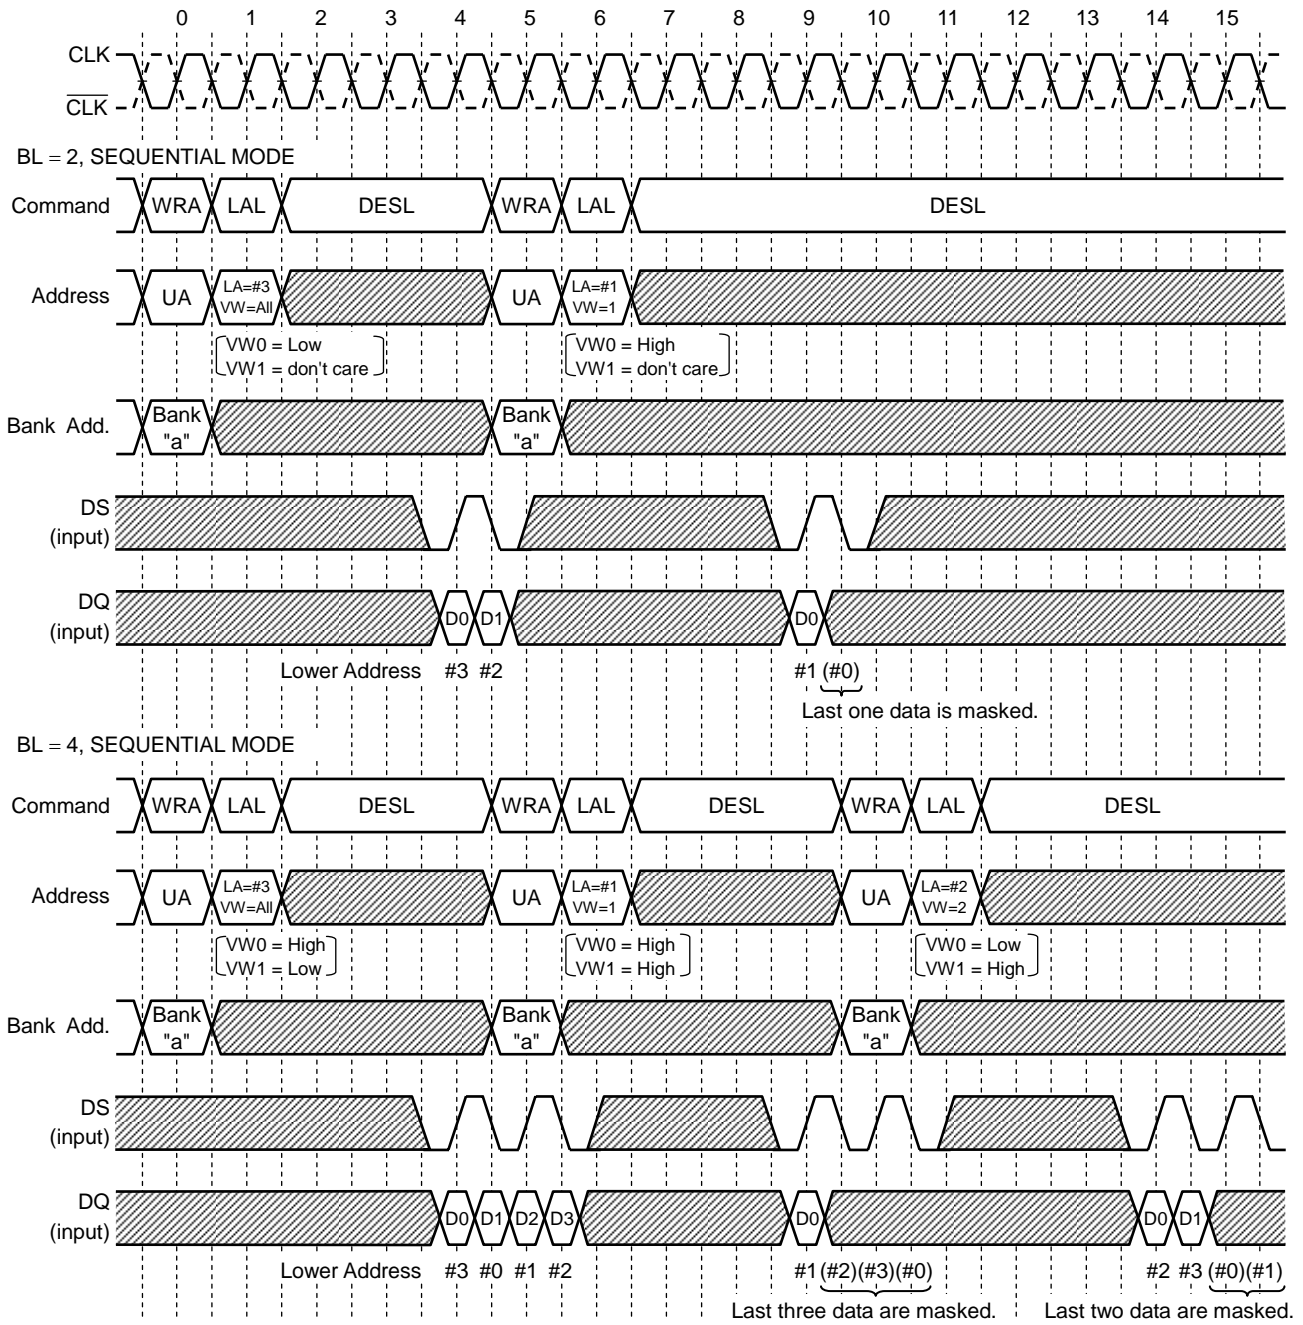

Note: I_{RC} to the same bank must be satisfied.

MULTIPLE BANK READ-WRITE TIMING (BL = 4)

WRITE with VARIABLE WRITE LENGTH (VW) CONTROL (CL = 4)

Note: DS input must be continued till end of burst count even if some of later data is masked.

POWER DOWN TIMING (CL = 4, BL = 4)

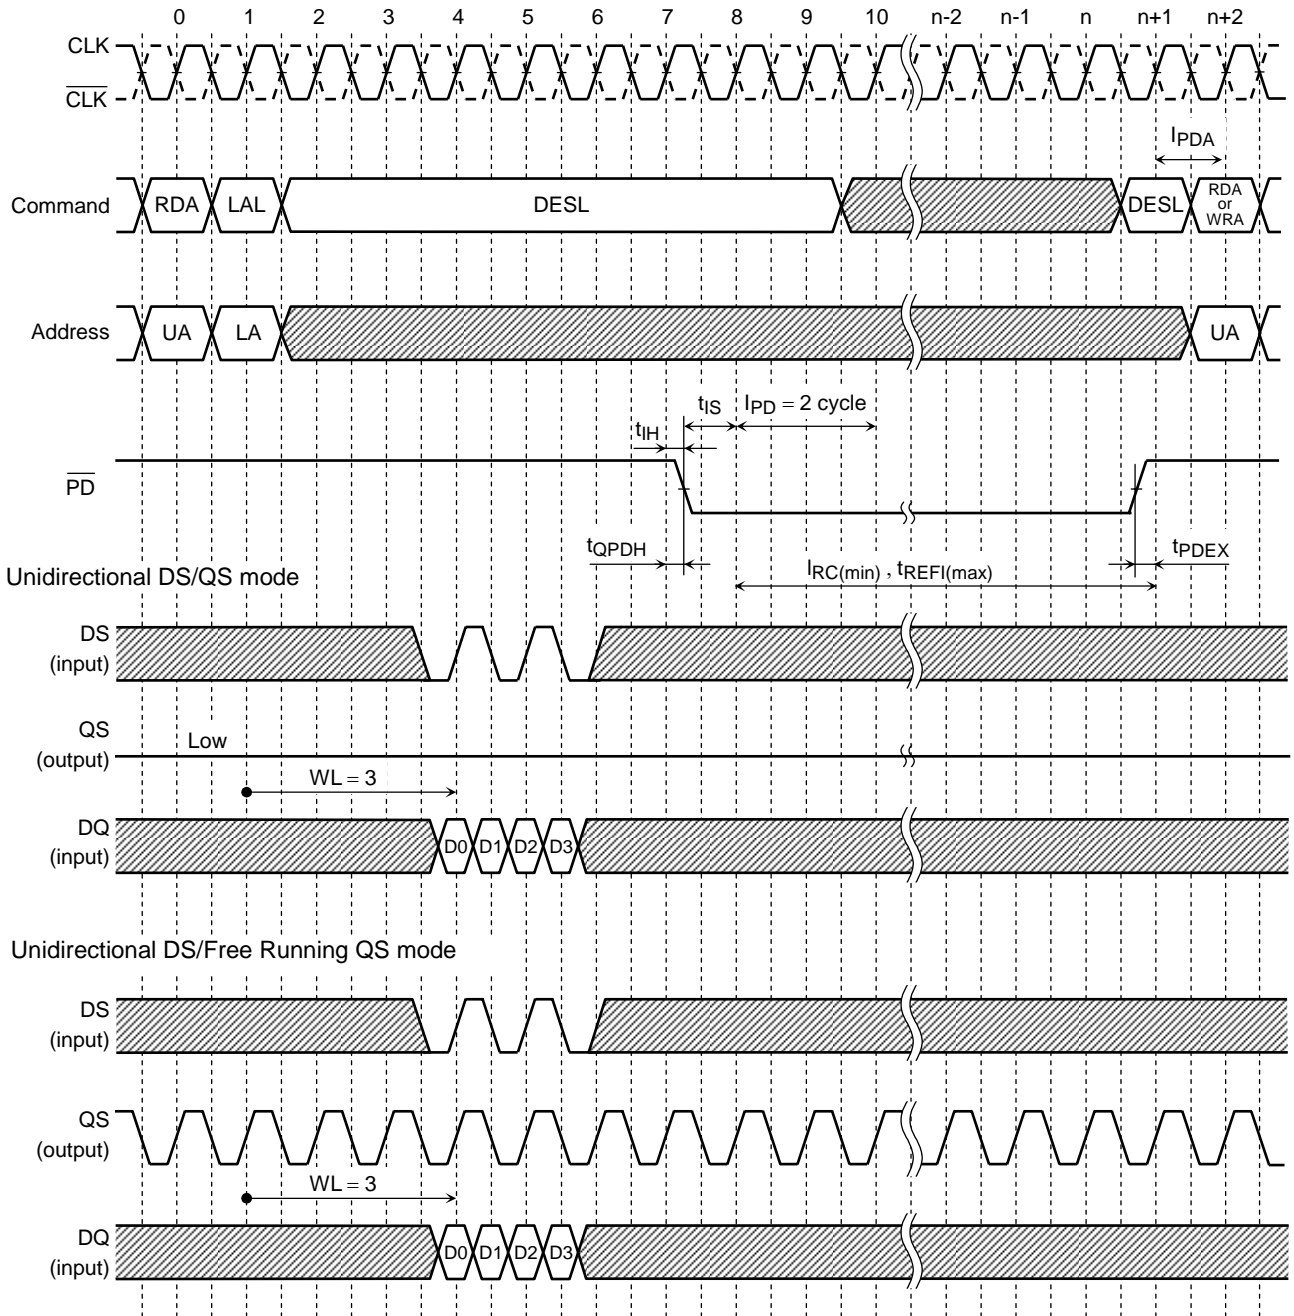

Read cycle to Power Down Mode

Note: \overline{PD} must be kept "High" level until end of Burst data output.
 \overline{PD} should be brought to "High" within $t_{REFI(max)}$ to maintain the data written into cell.
 In Power Down Mode, \overline{PD} "Low" and a stable clock signal must be maintained.
 When \overline{PD} is brought to "High", a valid executable command may be applied I_{PDA} cycles later.

POWER DOWN TIMING (CL = 4, BL = 4)

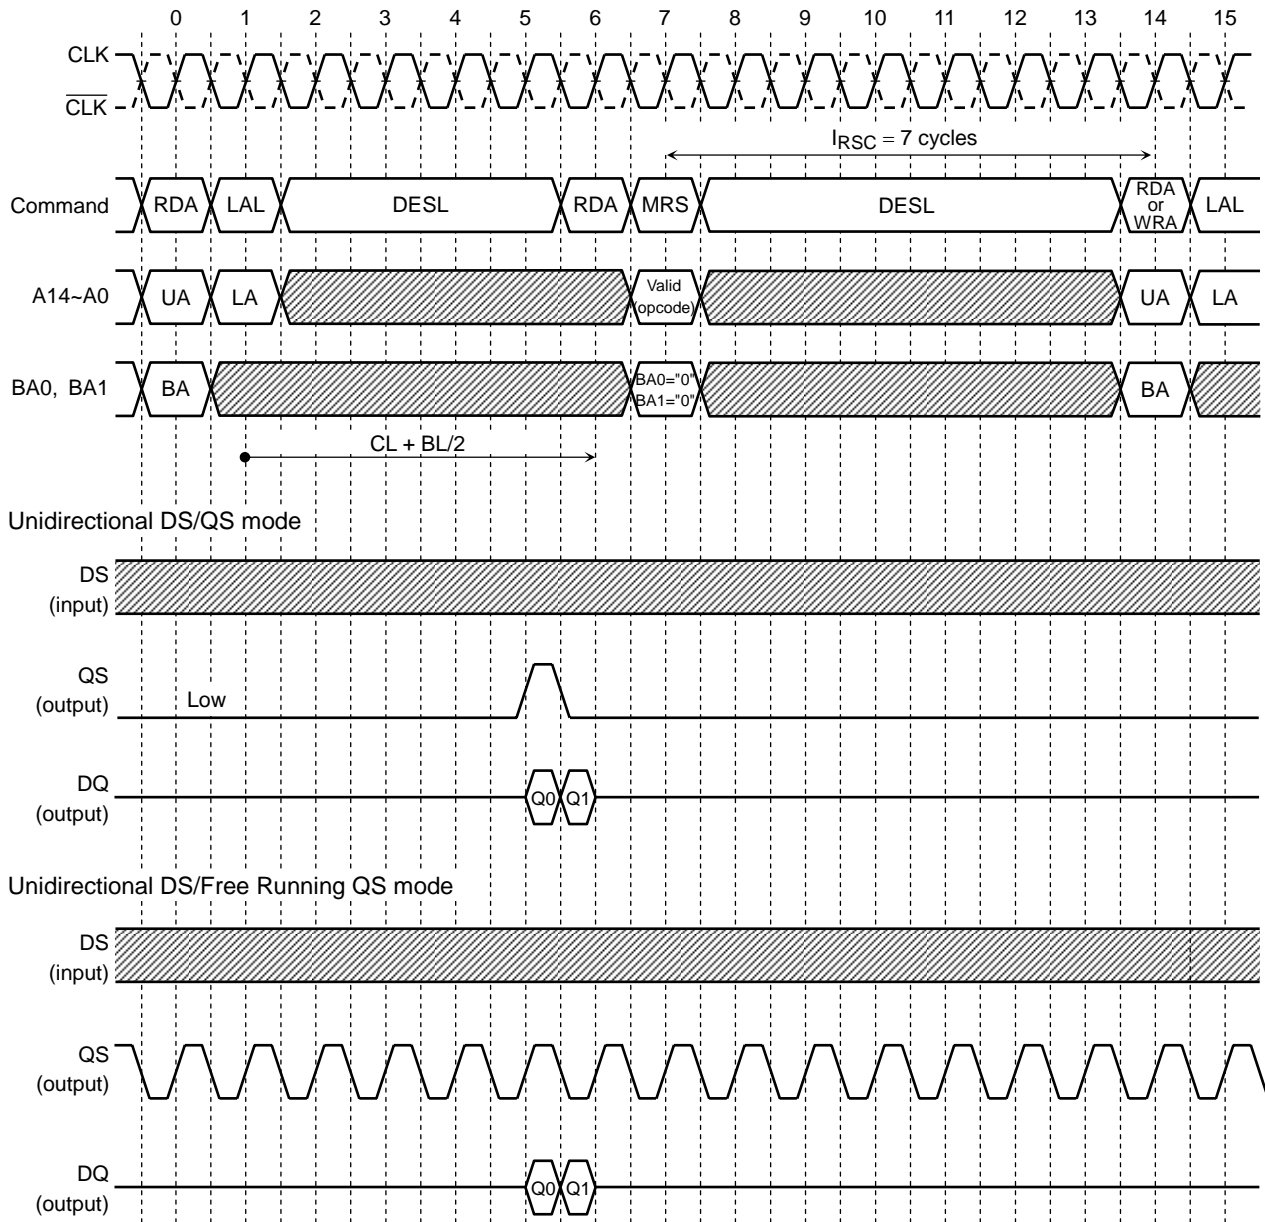

Write cycle to Power Down Mode

Note: \overline{PD} must be kept "High" until WL+2 clock cycles from LAL command.
 \overline{PD} should be brought to "High" within $t_{REFI(max.)}$ to maintain the data written into cell.
 In Power Down Mode, \overline{PD} "Low" and a stable clock signal must be maintained.
 When \overline{PD} is brought to "High", a valid executable command may be applied I_{PDA} cycles later.

MODE REGISTER SET TIMING (CL = 4, BL = 2)

From Read operation to Mode Register Set operation.

Note: Minimum delay from LAL following RDA to RDA of MRS operation is CL+BL/2.

MODE REGISTER SET TIMING (CL = 4, BL = 4)

From Write operation to Mode Register Set operation.

Note: Minimum delay from LAL following WRA to RDA of MRS operation is $WL+BL/2$.

EXTENDED MODE REGISTER SET TIMING (CL = 4, BL = 2)

From Read operation to Extended Mode Register Set operation.

Note: Minimum delay from LAL following RDA to RDA of EMRS operation is CL+BL/2.
 When DQ strobe mode is changed by EMRS, QS output is invalid for IRSC period.
 DLL switch in Extended Mode Register must be set to enable mode for normal operation.
 DLL lock-on time is needed after initial EMRS operation. See Power Up Sequence.

EXTENDED MODE REGISTER SET TIMING (CL = 4, BL = 4)

From Write operation to Extended Mode Register Set operation.

Note: When DQ strobe mode is changed by EMRS, QS output is invalid for I_{RSC} period.
 DLL switch in Extended Mode Register must be set to enable mode for normal operation.
 DLL lock-on time is needed after initial EMRS operation. See Power Up Sequence.
 Minimum delay from LAL following WRA to RDA of EMRS operation is WL+BL/2.

AUTO-REFRESH TIMING (CL = 4, BL = 4)

Note: In case of CL = 4, IREFC must be meet 19 clock cycles.
 When the Auto-Refresh operation is performed, the synthetic average interval of Auto-Refresh command specified by tREFI must be satisfied.
 tREFI is average interval time in 8 Refresh cycles that is sampled randomly.

$$t_{REFI} = \frac{\text{Total time of 8 Refresh cycle}}{8} = \frac{t_1 + t_2 + t_3 + t_4 + t_5 + t_6 + t_7 + t_8}{8}$$

tREFI is specified to avoid partly concentrated current of Refresh operation that is activated larger area than Read / Write operation.

FUNCTIONAL DESCRIPTION

Network FCRAM™

The FCRAM™ is an acronym of Fast Cycle Random Access Memory.

The Network FCRAM™ is competent to perform fast random core access, low latency and high-speed data transfer.

PIN FUNCTIONS

CLOCK INPUTS: CLK & $\overline{\text{CLK}}$

The CLK and $\overline{\text{CLK}}$ inputs are used as the reference for synchronous operation. CLK is master clock input. The $\overline{\text{CS}}$, FN and all address input signals are sampled on the crossing of the positive edge of CLK and the negative edge of $\overline{\text{CLK}}$. The QS and DQ output data are aligned to the crossing point of CLK and $\overline{\text{CLK}}$. The timing reference point for the differential clock is when the CLK and $\overline{\text{CLK}}$ signals cross during a transition.

POWER DOWN: $\overline{\text{PD}}$

The PD input controls the entry to the Power Down modes. The $\overline{\text{PD}}$ input does not have a Clock Suspend function like a CKE input of a standard SDRAMs, therefore it is illegal to bring $\overline{\text{PD}}$ pin into low state if any Read or Write operation is being performed.

CHIP SELECT & FUNCTION CONTROL: $\overline{\text{CS}}$ & FN

The $\overline{\text{CS}}$ and FN inputs are a control signal for forming the operation commands on FCRAM™. Each operation mode is decided by the combination of the two consecutive operation commands using the $\overline{\text{CS}}$ and FN inputs.

BANK ADDRESSES: BA0 & BA1

The BA0 and BA1 inputs are latched at the time of assertion of the RDA or WRA command and are selected the bank to be used for the operation. BA0 and BA1 also define which mode register is loaded during the Mode Register Set command (MRS or EMRS).

	BA0	BA1
Bank #0	0	0
Bank #1	1	0
Bank #2	0	1
Bank #3	1	1

ADDRESS INPUTS: A0~A14

Address inputs are used to access the arbitrary address of the memory cell array within each bank. The Upper Addresses with Bank addresses are latched at the RDA or WRA command and the Lower Addresses are latched at the LAL command. The A0 to A14 inputs are also used for setting the data in the Regular or Extended Mode Register set cycle.

I/O Organization	UPPER ADDRESS	LOWER ADDRESS
18 bits	A0~A14	A0~A6

DATA INPUT/OUTPUT: DQ0~DQ17

The input data of DQ0 to DQ17 are taken in synchronizing with the both edges of DS input signal. The output data of DQ0 to DQ17 are outputted synchronizing with the both edges of QS output signal.

DATA STROBE: DS, QS

Method of data strobe is chosen by Extended mode register.

(1) Unidirectional DS / QS mode

DS is input signal and QS is output signal. Both edges of DS are used to sample all DQs at Write operation. Both edges of QS are used for trigger signal of all DQs at Read operation. During Write, Auto-Refresh and NOP cycle, QS assert always "Low" level.

(2) Unidirectional DS / Free running QS mode

DS is input signal and QS is output signal. Both edge of DS are used to sample all DQs at Write operation. Both edges of QS are used for trigger signal of all DQs at Read operation. QS assert always toggle signal. This strobe type is easy to use for pin to pin connect application.

POWER SUPPLY: VDD, VDDQ, VSS, VSSQ

VDD and VSS are power supply pins for memory core and peripheral circuits.

VDDQ and VSSQ are power supply pins for the output buffer.

REFERENCE VOLTAGE: VREF

VREF is reference voltage for all input signals.

COMMAND FUNCTIONS and OPERATIONS

TC59LM818DMBI are introduced the two consecutive command input method. Therefore, except for Power Down mode, each operation mode decided by the combination of the first command and the second command from stand-by states of the bank to be accessed.

Read Operation (1st command + 2nd command = RDA + LAL)

Issuing the RDA command with Bank Addresses and Upper Addresses to the idle bank puts the bank designated by Bank Address in a read mode. When the LAL command with Lower Addresses is issued at the next clock of the RDA command, the data is read out sequentially synchronizing with the both edges of QS output signal (Burst Read Operation). The initial valid read data appears after $\overline{\text{CAS}}$ latency from the issuing of the LAL command. The valid data is outputted for a burst length. The $\overline{\text{CAS}}$ latency, the burst length of read data and the burst type must be set in the Mode Register beforehand. The read operated bank goes back automatically to the idle state after IRC.

Write Operation (1st command + 2nd command = WRA + LAL)

Issuing the WRA command with Bank Addresses and Upper Addresses to the idle bank puts the bank designated by Bank Address in a write mode. When the LAL command with Lower Addresses is issued at the next clock of the WRA command, the input data is latched sequentially synchronizing with the both edges of DS input signal (Burst Write Operation). The data and DS inputs have to be asserted in keeping with clock input after $\overline{\text{CAS}}$ latency-1 from the issuing of the LAL command. The DS has to be provided for a burst length. The $\overline{\text{CAS}}$ latency and the burst type must be set in the Mode Register beforehand. The write operated bank goes back automatically to the idle state after IRC. Write Burst Length is controlled by VW0 and VW1 inputs with LAL command. See VW truth table.

Auto-Refresh Operation (1st command + 2nd command = WRA + REF)

TC59LM818DMBI are required to refresh like a standard SDRAM. The Auto-Refresh operation is begun with the REF command following to the WRA command. In a point to notice, the write mode started with the WRA command is canceled by the REF command having gone into the next clock of the WRA command instead of the LAL command. The minimum period between the Auto-Refresh command and the next command is specified by IREFC. However, about a synthetic average interval of Auto-Refresh command, it must be careful. In case of equally distributed refresh, Auto-Refresh command has to be issued within once for every 1.95 μs by the maximum. In case of burst refresh or random distributed refresh, the average interval of eight consecutive Auto-Refresh commands has to be more than 400 ns always. In other words, the number of Auto-Refresh cycles that can be performed within 3.2 μs ($8 \times 400 \text{ ns}$) is to 8 times in the maximum.

Power Down Mode ($\overline{\text{PD}} = \text{"L"}$)

When all banks are in the idle state and DQ outputs are in Hi-Z states, the TC59LM818DMBI become Power Down Mode by asserting $\overline{\text{PD}}$ is "Low". When the device enters the Power Down Mode, all input and output buffers are disabled after specified time except for $\overline{\text{PD}}$, CLK, $\overline{\text{CLK}}$ and QS. Therefore, the power dissipation lowers. To exit the Power Down Mode, $\overline{\text{PD}}$ has to be brought to "High" and the DESL command has to be issued for LPDA cycle after $\overline{\text{PD}}$ goes high. The Power Down exit function is asynchronous operation.

Mode Register Set (1st command + 2nd command = RDA + MRS)

When all banks are in the idle state, issuing the MRS command following to the RDA command can program the Mode Register. In a point to notice, the read mode started with the RDA command is canceled by the MRS command having gone into the next clock of the RDA command instead of the LAL command. The data to be set in the Mode Register is transferred using A0 to A14, BA0 and BA1 address inputs. The TC59LM818DMBI have two mode registers. These are Regular and Extended Mode Register. The Regular or Extended Mode Register is chosen by BA0 and BA1 in the MRS command. The Regular Mode Register designates the operation mode for a read or write cycle. The Regular Mode Register has four function fields.

The four fields are as follows:

- (R-1) Burst Length field to set the length of burst data
- (R-2) Burst Type field to designate the lower address access sequence in a burst cycle
- (R-3) $\overline{\text{CAS}}$ Latency field to set the access time in clock cycle
- (R-4) Test Mode field to use for supplier only.

The Extended Mode Register has three function fields.

The three fields are as follows:

- (E-1) DLL Switch field to choose either DLL enable or DLL disable
- (E-2) Output Driver Impedance Control field.
- (E-3) Data Strobe Select

Once those fields in the Mode Register are set up, the register contents are maintained until the Mode Register is set up again by another MRS command or power supply is lost. The initial value of the Regular or Extended Mode Register after power-up is undefined, therefore the Mode Register Set command must be issued before proper operation.

- Regular Mode Register/Extended Mode Register change bits (BA0, BA1)
These bits are used to choose either Regular MRS or Extended MRS

BA1	BA0	Mode Register Set
0	0	Regular MRS
0	1	Extended MRS
1	×	Reserved

Regular Mode Register Fields

- (R-1) Burst Length field (A2 to A0)

This field specifies the data length for column access using the A2 to A0 pins and sets the Burst Length to be 2 or 4 words.

A2	A1	A0	BURST LENGTH
0	0	0	Reserved
0	0	1	2 words
0	1	0	4 words
0	1	1	Reserved
1	×	×	Reserved

- (R-2) Burst Type field (A3)

The Burst Type can be chosen Interleave mode or Sequential mode. When the A3 bit is "0", Sequential mode is selected. When the A3 bit is "1", Interleave mode is selected. Both burst types support burst length of 2 and 4 words.

A3	BURST TYPE
0	Sequential
1	Interleave

• Addressing sequence of Sequential mode (A3)

A column access is started from the inputted lower address and is performed by incrementing the lower address input to the device.

Addressing sequence for Sequential mode

DATA	ACCESS ADDRESS	BURST LENGTH
Data 0	N	} 2 words (address bits is LA0) not carried from LA0~LA1
Data 1	n + 1	
Data 2	n + 2	} 4 words (address bits is LA1, LA0) not carried from LA1~LA2
Data 3	n + 3	

• Addressing sequence of Interleave mode

A column access is started from the inputted lower address and is performed by interleaving the address bits in the sequence shown as the following.

Addressing sequence for Interleave mode

DATA	ACCESS ADDRESS	BURST LENGTH
Data 0	...A8 A7 A6 A5 A4 A3 A2 A1 A0	} 2 words
Data 1	...A8 A7 A6 A5 A4 A3 A2 A1 $\overline{\text{A0}}$	
Data 2	...A8 A7 A6 A5 A4 A3 A2 $\overline{\text{A1}}$ A0	} 4 words
Data 3	...A8 A7 A6 A5 A4 A3 A2 $\overline{\text{A1}}$ $\overline{\text{A0}}$	

(R-3) $\overline{\text{CAS}}$ Latency field (A6 to A4)

This field specifies the number of clock cycles from the assertion of the LAL command following the RDA command to the first data read. The minimum value of $\overline{\text{CAS}}$ Latency depends on the frequency of CLK. In a write mode, the place of clock that should input write data is $\overline{\text{CAS}}$ Latency cycles - 1.

A6	A5	A4	$\overline{\text{CAS}}$ LATENCY
0	0	0	Reserved
0	0	1	Reserved
0	1	0	Reserved
0	1	1	Reserved
1	0	0	4
1	0	1	5
1	1	0	6
1	1	1	Reserved

(R-4) Test Mode field (A7)

This bit is used to enter Test Mode for supplier only and must be set to "0" for normal operation.

(R-5) Reserved field in the Regular Mode Register

- Reserved bits (A8 to A14)

These bits are reserved for future operations. They must be set to "0" for normal operation.

Extended Mode Register fields

(E-1) DLL Switch field (A0)

This bit is used to enable DLL. When the A0 bit is set “0”, DLL is enabled. This bit must be set to “0” for normal operation.

(E-2) Output Driver Impedance Control field (A1 to A4)

This field is used to choose Output Driver Strength. Three types of Driver Strength are supported. QS and DQ Driver Strength can be chosen separately. A2-A1 specified the DQ Driver Strength. A4-A3 specified the QS Driver Strength.

QS		DQ		OUTPUT DRIVER IMPEDANCE CONTROL
A4	A3	A2	A1	
0	0	0	0	Normal Output Driver
0	1	0	1	Strong Output Driver
1	0	1	0	Weak Output Driver
1	1	1	1	Reserved

(E-3) Strobe Select (A6 / A5)

Two types of data strobe are supported. This field is used to choose the type of data strobe.

(1) Unidirectional DS/QS mode

Data strobe is separated DS for write strobe and QS for read strobe.

DS is used to sample write data at write operation. QS is aligned with read data at Read operation.

(2) Unidirectional DS/Free running QS mode

Data strobe is separated DS for write strobe and QS for read strobe.

DS is used to sample write data at write operation. QS is aligned with read data and always clocking.

A6	A5	STROBE SELECT
0	0	Reserved
0	1	Reserved
1	0	Unidirectional DS/QS mode
1	1	Unidirectional DS/Free running QS mode

(E-4) Reserved field (A7 to A14)

These bits are reserved for future operations and must be set to “0” for normal operation.

PACKAGE DIMENSIONS

P-BGA60-0917-1.00AZ

Weight: 0.15g (typ.)

REVISION HISTORY

- Rev.1.0 (Feb. 25 '2004)

- Rev.1.1 (Aug. 27 '2004)
 - Some notes in the page 7 moved to page 6 (page 6, 7).
 - Note 2 changed as below (page 6).
 - Before: These parameters depend on the output loading. The specified values are obtained with the output open
 - After: These parameters define the current between V_{DD} and V_{SS}.
 - Corrected TYPO (page 8, 13~15, 51).
 - t_{CK, MAX} for "-30" changed from 7.5 ns to 5.0 ns (page 8)
 - V_{SWING} in AC test conditions changed from 0.7 V to 0.8 V (page 10)
 - Revision History added (page 54).

- Rev.1.2 (Mar. 7 '2005)
 - Corrected figure of I_{PDA} based AC timing spec table (page 11, 40, 41).

RESTRICTIONS ON PRODUCT USE

030619EBA

- The information contained herein is subject to change without notice.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others.
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- TOSHIBA products should not be embedded to the downstream products which are prohibited to be produced and sold, under any law and regulations.
