## 1. Functional Description

- 2-Bit Dual-Supply Bus Transceiver with Configurable Power Supply

## 2. General

The 74AVC2T45FK is a dual-supply, high-speed CMOS 2-bit bus transceiver that can interface between two systems with supply voltages from 0.8 V to 3.6 V. The two supply voltages can be user-configurable within the operating range and the sequence of supply voltage ON/OFF can be freely set.

When the transmission direction switching input DIR is set to "H", bus A becomes an input and bus B becomes an output, and when set to "L", bus A becomes an output and bus B becomes an input. The input (DIR) has a tolerant function that allows input of up to 3.6 V regardless of the supply voltage. When either power supply is at the GND level, the bus terminals are placed in a high impedance mode and a voltage of up to 3.6 V is allowed to be applied. This feature allows for partial power-down interface applications.

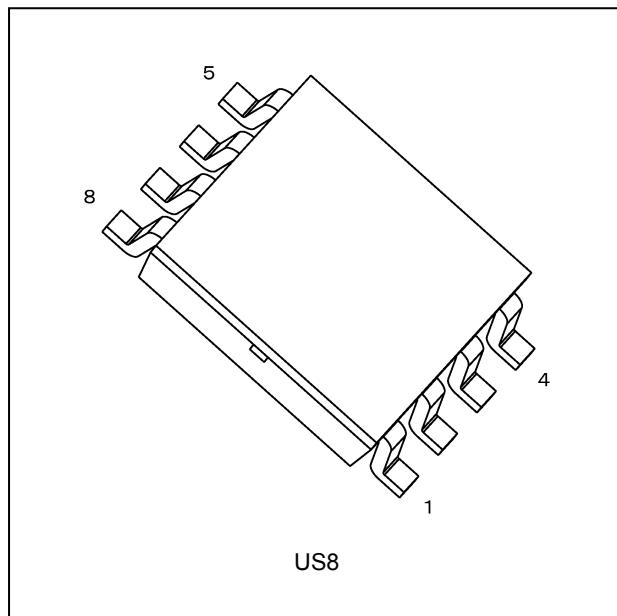

All inputs are equipped with protection circuits to protect the devices from electrostatic discharge damage.

## 9. Absolute Maximum Ratings (Note) (Unless otherwise specified, $T_a = 25^\circ\text{C}$ )

		(Note 2)	-0.5 to $V_{CCA} + 0.5$	
Input diode current	$I_{IK}$		-50	mA
	$I_{I/OK}$	(Note 3)	-50

Note: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.

Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.

Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note 1: Input state or high impedance state.

Note 2: Output state.  $I_{OUT}$  absolute maximum rating must be observed.

Note 3:  $V_{OUT} < GND$
